Understanding Hair Structure and Composition

The Milady Chapter 2 workbook answers begin with fundamental knowledge about hair's structure and composition. Hair is primarily composed of keratin, a fibrous protein that forms the hair's strength and resilience. Understanding the anatomy of hair involves recognizing its three main layers: the cuticle, cortex, and medulla. Each layer plays a specific role in hair health and appearance.

The Cuticle Layer

The cuticle is the outermost layer of the hair shaft, consisting of overlapping scale-like cells that protect the inner layers. Its condition affects the hair's shine and smoothness. Damage to the cuticle can result in dullness and increased porosity, which impacts chemical treatments and moisture retention.

The Cortex Layer

The cortex forms the bulk of the hair and contains fibrous proteins and the pigment responsible for hair color. It determines the hair's elasticity and tensile strength. Any alterations in the cortex during chemical processes affect the hair's texture and color.

The Medulla Layer

The medulla is the innermost core, present only in thick or coarse hair types. It is composed of soft keratin and air spaces. While not always present, the medulla contributes to hair's overall structure and thickness.

- Keratin protein is the primary component of hair.
- Cuticle protects the inner cortex and medulla.
- Cortex contains pigment and determines elasticity.
- Medulla is present in coarse hair and adds thickness.

Hair Growth Cycle and Phases

A critical section of Milady Chapter 2 workbook answers pertains to the hair growth cycle. Hair growth occurs in three distinct phases: anagen, catagen, and telogen. Each phase influences hair length, density, and shedding patterns.

Anagen Phase

The anagen phase is the active growth stage lasting between two and six years. During this phase, hair follicles produce new cells rapidly, leading to hair lengthening. The duration of anagen determines the maximum length of hair.

Catagen Phase

The catagen phase is a transitional period lasting about two to three weeks. Hair growth slows, and the follicle shrinks, preparing for the resting phase. This phase signals the end of active hair production.

Telogen Phase

The telogen phase is the resting stage lasting around three months. Hair follicles remain inactive before shedding the old hair and starting a new growth cycle. Approximately 10-15% of hair is in this phase at any given time.

- Anagen: active growth lasting years.
- Catagen: brief transitional phase.

- Telogen: resting and shedding phase.
- Understanding these phases aids in hair care and treatment planning.

Hair Types and Texture Classification

Milady Chapter 2 workbook answers also include detailed information on hair types and texture classifications. Hair is categorized by its diameter, density, porosity, and elasticity, all of which affect styling and chemical processing outcomes.

Hair Diameter

Hair diameter refers to the thickness of individual strands. It is classified as fine, medium, or coarse. Fine hair tends to be more fragile, while coarse hair can withstand stronger chemical treatments.

Hair Density

Density measures the number of hair strands per square inch on the scalp. High density hair appears fuller, whereas low density hair looks thinner. Proper density assessment helps tailor haircut and styling techniques.

Hair Porosity

Porosity indicates the hair's ability to absorb and retain moisture. Low porosity hair resists moisture, while high porosity hair absorbs moisture quickly but loses it just as fast. Porosity affects product selection and treatment effectiveness.

Hair Elasticity

Elasticity refers to hair's ability to stretch and return to its original length without breaking. Healthy hair has good elasticity, which is vital for preventing damage during styling and chemical services.

- Diameter: fine, medium, coarse.
- Density: low, medium, high.
- Porosity: low, normal, high.
- Elasticity: measure of hair flexibility and strength.

Common Hair and Scalp Disorders

Another important area covered in Milady Chapter 2 workbook answers involves identifying common hair and scalp disorders. Recognizing these conditions is crucial for cosmetologists to recommend appropriate treatments and avoid exacerbating issues.

Dandruff and Seborrheic Dermatitis

Dandruff is characterized by flaking and itching of the scalp, often caused by dry skin or a yeast-like fungus. Seborrheic dermatitis is a more severe form involving inflammation and greasy scales. Both conditions require specific care protocols.

Alopecia

Alopecia involves hair loss that can be patchy or diffuse. It may result from genetics, hormonal changes, or medical conditions. Understanding the types of alopecia helps in advising clients on treatment options.

Ringworm (Tinea Capitis)

Ringworm is a contagious fungal infection causing scaly, itchy patches on the scalp. It requires medical treatment and professional salon protocols to prevent spread.

Scalp Psoriasis

Psoriasis manifests as red, itchy, and scaly patches on the scalp. While not contagious, it can cause discomfort and requires careful product choices to manage symptoms.

- Dandruff: flaking and itching.
- Seborrheic dermatitis: inflamed scalp condition.
- Alopecia: various types of hair loss.
- Ringworm: contagious fungal scalp infection.
- Psoriasis: chronic inflammatory scalp disorder.
